Abstract

This study aims to determine (1) the learning outcomes of students' PPKn taught by the Problem Based Learning model through home visits are higher than the PPKn learning outcomes of students taught by the Problem Based Learning model through Google Classroom; (2) PPKn learning outcomes of students who have high learning motivation are higher than students who have low learning motivation; (3) The interaction between the Problem Based Learning model through home visits and learning motivation on the learning outcomes of fourth grade PPKn at UPT SPF SDN 106828 Sumberjo. This research is in the form of a quasi-experimental design with a 2 x 2 factorial design. The population of this research is all fourth-grade students of UPT SPF SDN 106828, which are 2 classes with a total of 54 students. The sample selection was taken by using a total sampling technique, namely from the two classes as a whole set as a sample. Thus, the sample was determined, namely class IVA as group A and class IVB as group B. Class determination for the application of the learning model was determined by group A consisting of 27 students for classes taught using the Problem Based Learning model through home visits, and group B consisting of 27 students for classes taught using the Problem Based Learning model through Google Classroom. The research instrument used a multiple-choice learning
outcome test with 25 questions and a student learning motivation instrument in the form of a questionnaire consisting of 40 items that were declared valid and reliable. Data analysis using two-way Anova. The results showed that (1) the learning outcomes of PPKn Education students who were taught using the Problem Based Learning model through home visits were higher than the Problem Based Learning model through the Google Classroom; (2) PPKn learning outcomes of students who have high learning motivation are higher than students who have low learning motivation; (3) There is an interaction between the learning model and learning motivation in influencing student PPKn learning outcomes.

**Keywords:** learning outcomes, learning motivation, learning model problem based learning.

A. Introduction

Education is one thing that is very important for humans because education involves human survival. Education is a very important process carried out to improve intelligence, skills, enhance character, strengthen personality and increase the spirit of togetherness in order to build oneself and society in building the nation and state (Andika et al., 2016; Maryatin & Metro 2017). Therefore, education is the main key in improving the quality of superior human resources in various aspects of life.

According to Susiwi Indriani (2018) stating that Pancasila and Citizenship Education (PPKn) is one of the compulsory subjects ranging from Elementary School to Higher Education which has a very important role in efforts to form citizens who have intelligence, pride and responsibility and are able to participate in the life of society and the state.

The development of the Industrial Revolution 4.0 where the internet and Information and Communication Technology (ICT) are needed and play an important role in everyday life. It can be seen that
many children are addicted to using technological tools such as mobile phones, the Internet which is used only for playing and learning a little. The paradigm shift in educational education leads to demands for changes in learning, from conventional to multimedia-based learning sourced from the internet, an important part of learning resources so that teachers will adapt to information and communication technology in the learning that is brought in the classroom. So that in the digital era of Industrial Revolution 4.

Teachers are expected to be able to design an appropriate learning model to be used during the PPKn learning process so that the PPKn learning process itself does not end to be monotonous and boring because the teacher in each lesson only uses the lecture method and students are only told to record the material in the student's notebook. With a learning model that is designed as attractive as possible, students will be excited and attract their attention so as to hone their curiosity about something new.

The achievement of the teaching and learning process is highly dependent on the teacher's role in learning activities in the classroom. One of the internal factors that greatly affect the student's learning process is learning motivation. Students will succeed in learning if they have their own desire to learn. In this case, the teacher's task is to increase students' learning motivation so that they want to learn the material being taught. In addition, by increasing student learning motivation, it affects learning outcomes where these changes mean an increase and development that is better than before.

Based on data obtained from the Administrative OfficeSD Negeri 106828 Kec. Pagar Merbau Kab. Deli Serdang, it can be seen that the average UAS scores of fourth graders for PPKn subjects in the last three
semestersthat the average value of the PPKn subject for the last three semesters has not reached the KKM. This means that student PPKn learning outcomes are still relatively low because the average value obtained is still below the value of 75. In addition, based on the results of interviews with several teachers at the school showed that the teachers at the school still used the lecture learning model in which the learning process was only teacher-centred and did not involve students to actively participate in learning, so that students became bored due to monotonous learning.

An inappropriate learning process will result in low student learning outcomes. Low learning outcomes can be sourced from the teacher’s lack of knowledge in choosing the right model or strategy in providing learning to students, causing boring learning activities that are difficult for students to accept, it will have an impact on learning outcomes and low student motivation. For example, students are lazy to deal with PPKn subjects as stated by Salani & Maphane (2014).

The selection of the right learning model is one of the supporting factors for achieving maximum learning outcomes. Because the use of the right learning model will make the learning atmosphere interesting and not boring. So it is necessary to apply a learning model in increasing student motivation and learning outcomes, one of which is by using a learning model problem based learning. Problem based learning model is problem based learning.

Problem Based Learning model is defined as a learning model in which it involves students to try to solve problems by going through several stages of the scientific method so that students are expected to be able to learn knowledge related to the problem and at the same time students are expected to have problem solving skills.
Another opinion that reinforces that problem-based learning can improve student learning outcomes and motivation is also strengthened by Rahmat (2018) which states that the application of the Problem Based Learning model exposes students to a problem so that they are motivated to seek answers by repeatedly solving the problems they face. which in turn can solve the problem so that it can increase students' confidence in their abilities.

In addition, San (2016) The results of the study show, (1) overall science learning outcomes of students who follow the PBL model are higher than students who follow the direct learning model, this means that the PBL model has an effect on science learning outcomes; (2) there is an interaction effect between the learning model and learning motivation on science learning outcomes, (3) the science learning outcomes of students who follow the PBL model who have high learning motivation are better than students who follow the PBL model. direct learning model in groups of students who have high learning motivation, (4) science learning outcomes of students who follow the PBL model who have low learning motivation are better than students who follow direct learning models in groups of students who have low learning motivation.

Adela (2018) The results show that there is an influence of the PBL model on student learning outcomes in PPKn Learning for class V SDN 09 Bandarbuat. Based on the t-value of -2.488 with a P-Value of 0.016. The P-Value value is smaller than = 0.05 so H1 is accepted.

The difference between my research and previous studies is that it emphasizes the Problem Based learning model through home visits in improving student learning outcomes because learning carried out in schools is still carried out only twice a week because it is still in a limited Face-to-Face Learning (PTMT) situation
B. Method

In carrying out the research the author took the location at UPT SPF SDN 106828 Kec. Pagar Merbau Kab. Deli Serdang. And it will be held from November to December of the 2021-2022 school year. The population in this study were all fourth grade students of UPT SPF SDN 106828 Kec. Pagar Merbau Kab. Deli Serdang as many as 54 students spread over 2 classes, namely IV-A and IV-B. The sample in this study was taken as a whole population of 54 students consisting of 27 students in class IV-A and 27 students in class IV-B. In this case, the experimental class is class IV-A by applying the Problem Based Learning model through home visits, while class IV-B is the class that is taught using the Problem Based Learning model through google classroom. This research is a quasi-experimental study with a 2x2 factorial design. The dependent variable in this study is the learning outcomes of PPKn grade IV SD on the theme "Various Jobs" Sub-theme "My Parents' Jobs" Content of PPKn Materials.

1. Research Instruments

Learning Motivation Questionnaire

To determine the level of student motivation, the researchers used a questionnaire to measure the level of student motivation. Sugiyono (2015:199) said that the questionnaire is a data collection technique which is done by giving a set of questions or written statements to the respondents to answer.

Study Results Test

The test is used to determine the level of students' understanding of the material presented. The learning outcomes test refers to the theme of “Various Jobs”, the sub-theme of my parents' work. Learning outcomes
test in the form of multiple choice as many as 25 questions. Research procedure

The author in carrying out this research will take the following steps:

1. Preliminary studies
2. Proposal Making
3. Instrument Making
4. Pre-test
5. Conducting Research
6. Motivation
7. Group A: PBL Model Via Visit Home
8. Group B: PBL Model Through Google classroom
9. Post-test
10. Data analysis
11. Conclusion
2. Data analysis technique

Testing the truth of a study requires appropriate data analysis techniques to be used. The data analysis technique used in this research is inferential statistical technique. Hypothesis testing in this study was carried out by using two-way analysis of variance (ANAVA) or Two Way Anova with a significant level of 0.05. Before the two-way ANOVA test was carried out, the analysis requirements test was first carried out, namely the normality test and the data homogeneity test.

C. Finding and Discussion

1. Result

Data Description

1) Pre Test PPKn Learning Outcomes for Group A Students

![Bar Chart]

**Figure 1.** Pre-Test Histogram of PPKn Learning Outcomes for Group A Students

Based on the figure, it can be seen that the results of the pre-test group A with the highest number of frequencies are in the interval class

[196]
58-63, while the number of frequencies with the lowest number is in the interval class 40-45.

**Figure 2.** Pre-Test Histogram of PPKn Learning Outcomes for Group B Students

Based on the figure, it can be seen that the PPKn learning outcomes of students in group B with the highest number of frequencies are in the interval class 59-66, while the least frequency is in the interval class 35-42.

3) **Post-test PPKn Learning Outcomes of Students Taught with Problem Based Learning Models Through Home Visits**
Based on Figure 5 it is clear that the PPKn learning outcomes of students who are taught using a problem based learning model through home visits have the highest number of frequencies in the 85-90 interval class.

4) Post-test PPKn Learning Outcomes of Students Taught with Problem Based Learning Models Through Google Classroom
Figure 6. Histogram of PPKn Learning Outcomes of Students Taught with Problem Based Learning Models Through Google Classroom

From Figure, it is clear that the PPKn learning outcomes of students who are taught using the problem based learning model through Google Classroom have the highest number of frequencies in the 78-84 interval class, while the least number of frequencies are in the 91-96 and 97-102 interval classes.

5) PPKn Learning Outcomes of Students Who Have High Learning Motivation

From Figure, it can be seen that the results of PPKn learning of students who have high learning motivation with the highest number of frequencies are in the interval class 85-90, while the least are in classes 67-72 and 79-84.
6) **PPKn Learning Outcomes of Students Who Have Low Learning Motivation**

The results of PPKn learning outcomes of students who have low learning motivation with the highest number of frequencies are in the 87-91 interval class.

7) **PPKn Learning Outcomes of Students who are Taught with Problem Based Learning Models Through Home Visits and Have High Learning Motivation**

The results of PPKn learning of students who are taught using a problem based learning model through home visits and have high learning motivation with the highest number of frequencies are in the 87-90 interval class.

8) **PPKn Learning Outcomes of Students who are Taught with Problem Based Learning Models Through Home Visits and Have Low Learning Motivation**

The results of PPKn learning students who are taught using a problem based learning model through home visits and have low learning motivation with the highest number of frequencies are in the interval class 87-90, while the least number of frequencies is in the interval class. 83-86 checkers 95-98.

9) **PPKn Learning Outcomes of Students who are Taught with Problem Based Learning Learning Models through Google Classroom and Have High Learning Motivation**

The results of PPKn learning for students who are taught using the problem based learning model through Google Classroom and have high
learning motivation with the highest number of frequencies are in the 74-80 interval class.

10) PPKn Learning Outcomes of Students who are Taught with Problem Based Learning Models through Google Classroom and Have Low Learning Motivation

The results of PPKn learning outcomes of students who are taught using the problem based learning model through Google Classroom and have low learning motivation with the highest number of frequencies are in the 82-85 interval class.

Data Analysis Test

1) Normality test

Table 1. Normality Test Results of Pre-test Data

<table>
<thead>

Based on Table it can be explained about the research hypothesis testing as follows:
There is an interaction between the learning model and student motivation in influencing student learning outcomes. The interaction of learning models and learning motivation in influencing student PPKn learning outcomes can be seen in the following figure:

Figure 8. Graph of Interaction of Learning Models and Learning Motivation in Influencing PPKn Learning Outcomes

2. Discussion

a. PPKn Learning Outcomes of Students Taught with Problem Based Learning Models Through Home Visits are Higher than Problem Based Learning Models Through Google Classroom

Based on the research findings, it is known that the PPKn learning outcomes of students who are taught with the PBL learning model are higher than the PBL learning model through google classroom. The difference is so
significant. Based on the results of the researcher's analysis during research, the influencing factors are factors that are also found by many other researchers, namely the tendency of teachers who have not been able to use or apply technology optimally so that the function of Google Classroom as a learning medium cannot be explored maximally. In addition to these factors, the visit home method is a very effective alternative used by teachers in the era of distance learning.

Based on this description, it can be concluded that the use of problem based learning models through home visits in learning can improve student learning outcomes during distance learning with the assumption that students will be interested in learning if the learning is designed as attractive as possible and interacts as real as possible. If using Google Classroom, students' motivation tends to decrease due to monotonous learning caused by the inability of the teacher to mix learning using Google Classroom.

b. **PPKn Learning Outcomes of Students with High Learning Motivation are Higher than Students with Low Learning Motivation**

Based on the results of the study, it was found that the PPKn learning outcomes of students who had high learning motivation were higher than students who had low learning motivation. This is of course due to the learning provided by teachers to students during the pandemic. Many of the teachers are not ready to use technology in learning, causing students' learning motivation to decrease (Yusrizal & Fatmawati, 2020). In another study, Suryati (2020) also mentioned the same thing which stated that an increase in student learning outcomes was influenced by learning motivation.

Problem based learning learning model is a learning model that has a good stimulus for students, because the problem based learning model
provides a real picture of learning. By providing a real picture, it will increase children's motivation to study harder. Motivating students by using learning models is one thing that is highly recommended for every teacher, because motivation can be formed from anything that looks creative and innovative (Dwita et al., 2018). Based on this description, it can be concluded that students' learning motivation in the distance learning period greatly affects student learning outcomes.

c. The Interaction between Learning Models and Learning Motivation on Student Civic Education Learning Outcomes

Based on the results of the study, it was found that there was an interaction between the learning model and student motivation in influencing student learning outcomes with Fcount = 6.268. The results also found that the learning outcomes of students who had high learning motivation who were taught using a problem based learning model through home visits were 90,667 while students who were taught using a problem based learning model through google classroom were 80,154. In addition, the learning outcomes of students who have low learning motivation who are taught using a problem based learning model through home visits are 81,200 while students who are taught a problem based learning model through google classroom are 80,643.

Thus it can be concluded that students with high learning motivation are not always properly taught by any method that is considered a good teacher. This is in line with the research results of Tomas (2020) who found in his research that there was a significant effect on student learning motivation using the PBL model rather than the conventional model on student learning outcomes. Therefore, teachers are required to be better able to choose learning models and be able to
adapt to the conditions of their students, both in terms of motivation, interests, interpersonal intelligence, social skills, and the like.

D. Conclusion

Based on the discussion that has been described previously, several conclusions can be drawn including the following:

1. PPKn learning outcomes of students who were taught using the problem based learning model through home visits were higher than the problem based learning model through google classroom (Fcount = 7.750 and sig. 0.008 <0.05).

2. PPKn learning outcomes of students who have high learning motivation are higher than students who have low learning motivation (Fcount = 5.097 and sig. 0.028 <0.05).

3. There is an interaction between learning model and learning motivation in influencing student PPKn learning outcomes (Fcount = 6.268 and sig. 0.016 <0.05).
